What renewables

Unlike hydrocarbon energies, renewable energy is developed from resources that are constantly replenished and will never run out.

- Solar power
- Wind power
- Biomass power
- Geothermal energy
- Ocean energy
- Hydropower

*Source: Renewables 2012 Global Status Report p 19; www.ren21.net*
Renewables Growth: Global

- Renewables grown 16.7% of global energy consumption
- Modern renewables increased to 8.2%
- Biomass, declined to 8.5%.
Renewables Growth: Global

1. Renewables account for half of the 208 gigawatts (GW) of electric capacity added globally 2011.
2. Wind and solar photovoltaics (PV*) accounted for 40% (new renewables) of 30%.
3. Hydropower accounted for 25%.
4. By the end of 2011, total renewable power capacity worldwide exceeded 1,360 GW, up 8% over 2010.
5. Renewables comprised more than 25% of total global power-generating capacity estimated at 5,360 GW in 2011 and supplied 20.3% of global electricity.
6. Non-hydropower renewables exceeded 390 GW, a 24% capacity increase over 2010.

* PV: solar photovoltaics
Renewables Grown: Pv*, CSP**, wind

1. Solar PVs grew the fastest of all renewables 2006-2011.
2. PV capacity increased by 58% annually.
3. Followed by (CSP), which increased 37% annually
4. Followed by wind power which increased 26%.

* PV: solar photovoltaics
** CSP: concentrating solar photovoltaic’s
Renewables Growth: Biofuels, biodiesel, Hydro, geothermal

The development of liquid biofuels has been mixed in recent years, with biodiesel production expanding in 2011 and ethanol production stable or down slightly compared with 2010. Hydropower and geothermal power are growing globally at rates averaging 2–3% per year. In several countries, however, the growth in these and other renewable technologies far exceeds the global average.
Renewable Energy Growth in All End Use Sectors

European Union
1. Renewables accounted for more than 71% of total electric capacity additions in 2011, bringing renewable energy’s share of total electric capacity to 31.1%.
2. Solar PVs* alone represented 47% of new capacity that came into operation.
3. In 2010, renewable share of total electricity consumption was 19.8% (up from 18.2% in 2009).
4. Renewables represented 12.4% of gross final energy consumption (compared to 11.5% in 2009).

* PV: solar photovoltaics
Germany is a top among the top user of renewable technologies for power, heating, and transport. In 2011, renewables provided 12.2% of Germany’s final energy consumption, 20% of electricity consumption (up from 11.6% in 2006), 10.4% of heating demand (up from 6.2%), and 5.6% of transport fuel (excluding air traffic).
Renewable Energy Growth in All End-Use Sectors

United States

1. Renewable energy made up 39% of national electric capacity additions in 2011.

2. The share of U.S. net electricity generation from non-hydropower renewables has increased from 3.7% in 2009 to 4.7% in 2011.

3. Nine states generated more than 10% of their electricity with non-hydro renewables in 2011, up from two states a decade ago.

4. All renewables accounted for 11.8% of U.S. primary energy production in 2011, up from 10.9% in 2010.
China ended 2011 with more renewable power capacity than any other nation, with an estimated 282 GW; one-quarter of this total (70 GW) was non-hydro. Of the 90 GW of electric capacity newly installed during the year, renewables accounted for more than one-third, and non-hydro renewables were more than one-fifth
Renewable Energy Growth in All End-Use Sectors

Wind
Several countries and states met higher shares of their electricity demand with wind power in 2011 than in 2010, including Denmark, where wind provided nearly 26% of electricity demand, Spain (15.9%), and Portugal (15.6%); four German states met more than 46% of their electricity needs with wind; the state of South Australia generated 20% of its demand from wind; and the U.S. states of South Dakota and Iowa produced 22% and 19% of their power from wind, respectively.
Top Countries of Renewables

1. The top seven countries for non-hydro renewable electric capacity—China, the United States, Germany, Spain, Italy, India, and Japan—accounted for about 70% of total capacity worldwide.

2. The ranking was quite different on a per-person basis, with Germany in the lead followed by Spain, Italy, the United States, Japan, China, and India.

3. By region, the EU was home to nearly 44% of global non-hydro renewable capacity at the end of 2011.

4. The BRICS nations accounted for almost 26%; their share has been increasing in recent years, but virtually all of this capacity is in China, India, and Brazil.
Investment Trends in Renewables

The top five countries for total investment were China, which led the world for the third year running, followed closely by the United States, and by Germany, Italy, and India. India displayed the fastest expansion in investment of any large renewables market in the world, with 62% growth. Developing countries accounted for USD 89 billion of new investment in 2011, compared with USD 168 billion in developed countries.
Solar Power

A Solar power plant the size of lake Nasser has the capacity of supplying the electricity needs of entire region

Wind Power
WIND POWER

WIND POWER TOTAL WORLD CAPACITY, 1996–2011

Wind Power Capacity, Top 10 Countries, 2011

Geothermal Energy
Geothermal Energy

Geothermal capacity grew by just 0.8% (88 MW) in 2011, to reach 11 GW. Geothermal capacity has now been overtaken by solar power capacity, but geothermal power runs at a much higher load factor solar (its source is continuous rather than intermittent), so geothermal still produces significantly more electricity than solar.

Only two major projects were completed in 2011, in Iceland (90 MW) and Costa Rica (42 MW), while Mexico shut down an old plant (78 MW). The US has the largest geothermal capacity, now just over 3.1 GW (28.3% of the world total), followed by the Philippines (2.0 GW), Indonesia (1.2 GW) and Mexico (0.9 GW).
Two geothermal systems were designed and are currently being installed by MENA Geothermal at the American University of Madaba (AUM), Jordan, to meet the full heating and cooling demands of the university.

The geothermal heating and cooling systems at AUM, once completed, will be the largest in the Arab region.

Source: AFED, 2011
1. The College of Science’s geothermal system is designed to meet a
   ▪ cooling load of 1020 kW* (291 tons)
   ▪ heating load of 880 kW (251 tons)

2. While the College of Business’s geothermal system is designed to meet a
   ▪ cooling load of 660 kW (189 tons)
   ▪ and heating load of 470 kW (134 tons)

Annual Energy and CO2 Savings. Compared to conventional heating and cooling systems used in Jordan, AUM’s geothermal heating and cooling system is expected to have annual savings of over 200,000 kWh of electricity in the summer months (cooling), and 90,000 liters of diesel fuel in the winter months (heating). In total, AUM will generate annual savings of over $85,000. Moreover, the geothermal system is expected to eliminate 365 tons of CO2 emissions every year.

Biomass energy
BIOMASS ENERGY

ETHANOL AND BIODIESEL PRODUCTION, 2000–2011

World biofuels production grew by 0.7% in 2011, the smallest increase since 2000. Increased output in North America was offset by declines in South & Central America and Europe. Biodiesel accounts for just 27.5% of global biofuels output, but accounted for all of the growth in global biofuels output. Global ethanol output declined by 1.4%.
Ocean Energy

Wave technology is the most exciting areas of untapped energy potential. Given fluctuating fuel prices and the impact of global warming, Ocean Energy is now in a very strong position to commercialize the vast body of research and development it has invested in over the past 10 years.

Source: http://www.oceanenergy.ie
Hydropower Energy

Hydropower or water power is power derived from the energy of falling water, which may be harnessed for useful purposes. Since ancient times, hydropower has been used for irrigation and the operation of various mechanical devices, such as watermills, sawmills, textile mills, dock cranes, domestic lifts and paint making.

MASEN (Morocco Agency for solar energy) projects

1. Ouarzazate Site:
with a surface of about 33 square kilometers. i.e. 3,300 Hectares. This site is located close to the Mansour Eddaibi dam whose storage capacity is 439 hm³. Energy produced by the power plant may be channeled to the 225/60 KV post of Ouarzazate which is close to the power plant.

2. Ain Beni Mathar Site.

3. The Foum El Oued Site.

4. Boujdour Site.

5. Sebkhat Tah Site.
Forecasted Renewable Costs

All costs are levelized in constant year 2000

The key elements of this cost-benefit calculus appear to be:

1. Declining costs (and thus prices) of renewable energy and other sustainability products as technology improves and economies of scale arrive.

2. Incentives that work in the favor of renewables: removal of subsidies for fossil fuels, tax credits for electric vehicles, etc.
RENEWABLE ENERGY SHARE OF GLOBAL FINAL ENERGY CONSUMPTION, 2010

Global energy

Modern Renewables 8.2%

Traditional Biomass 8.5%

Nuclear 2.7%

Fossil fuels 80.6%

Biofuels 0.7%

Wind/solar/biomass/geothermal power generation 0.9%

Hydropower 3.3%

Biomass/solar/geothermal hot water/heating 3.3%

Hypothetical energy consumption breakdown in a large office building in a given Arab country
Challenges
Major Challenges In Energy

- **Energy security**: fuel supply resources for the future
- **Economic growth**: accommodation of the developing nations’ needs
- **Environmental effects**: global warming and emission control
- **Electricity system reliability**: assurance of integrity of electric power infrastructure
Key Challenges In Renewable Expans

• Integration into the grid
  – interconnection
  – grid capability
  – reliability issues
  – power quality
• Competitiveness of technology costs
• Environmental problems
• Development of storage technology
• Government policies.
• Back up power.
• Green power differential.
Recommendations

- Remove the current obstacles that prevent the transition to green energy, which include the lack of investment in research and development, capacity building and integrated policy-making.

- To Reform the present legislative and institutional framework, to facilitate the transition to a green economy.

- To establish an incentive system that encourage investment in energy efficient technologies and renewable energy.

- To Adopt an energy efficiency plan and manage renewable energy issues as-pillars of a new energy policy, built on a coordinated effort involving the government, the private sector, the financial sector and other stakeholders.

- Constant adjustment for energy prices to reflect the actual economic cost, scarcity, the long-term marginal cost, and environmental damage. Further, it is required to reform the energy prices as an effective tool to rationalize energy consumption and to transform to low-carbon emission, which will concurrently lead to a vast increases in government revenues. Re-allocation of these revenues is also a must to enhance energy-efficient technologies and renewable energy expansion.

- To Begin a political discussion on the formulation of a new institutional mechanism, to ensure the harmonization of energy policies and climate change in the Arab region.
Renewable Energy

Renewable energy will stabilize electricity costs, as it is not dependent upon depleting resources. Photovoltaic systems will also increase access to electricity in rural areas without the need of complex policy decision-making, thus balancing the socioeconomic infrastructure of the region. For heating and cooling systems, and water desalinization.

Thus, when considering these energy options on a larger scale, renewable energy is the most efficient choice in the long-run. The vast solar potential of the Middle East is waiting to be tapped.
Thank you
